

ProofGate: Public Plans, Private Results

Prepare the right supplier negotiations.
Keep company facts and rules local.

Blind Workbench · synthetic supplier contracts

Which suppliers should we negotiate with?

The employee asks

**Within the next 60 days,
prepare at most two renewals,
earliest renewals first.**

The result should tell me who to contact
and the price ceiling to negotiate.

The company knows

Private supplier quotes and prices
Private price and service rules
Which renewals meet those rules

Those facts determine the selection
and the useful brief, inside the host.

Public intent is disclosed. The demonstrated records and rule bodies stay local. All records are synthetic.

Actual AI composes an approved method

Public request + capabilities

AI chose
60-day window
Earliest renewal first
At most 2 renewals

Admitted operations

1. Select renewals within 60 days
2. Apply private price ceiling
3. Rank by renewal date
4. Keep 2 renewals
5. Render the negotiation brief

The host checks the whole method before private access. No arbitrary code, SQL or network operations.

Private changes produce a different useful brief

Before the private change

Near + Middle

After quotes and the price rule change

Middle + Large

Negotiation ceilings

Middle: \$2,080 · Large: \$5,200

\$130 → \$1,060 potential annual opportunity · synthetic USD

03 Selected suppliers & negotiation brief

Selected suppliers · Middle Supplier / Large Supplier

Middle Supplier

Negotiate ceiling \$2080.00; potential annual saving \$360.00. Targets are not achieved savings.

Negotiation ceiling \$2,080.00 · potential annual saving \$360.00

Large Supplier

Negotiate ceiling \$5200.00; potential annual saving \$700.00. Targets are not achieved savings.

Negotiation ceiling \$5,200.00 · potential annual saving \$700.00

2 renewals; \$1060.00 potential annual saving (synthetic USD).

0 new provider attempts during local rebind

ProofGate controls each step

PUBLIC INPUT → HOSTED AI → ADMITTED METHOD

PRIVATE FACTS → LOCAL WORK

Authenticated host · current policy · finite shared allowance · observable audit and export

Inspect what the hosted models received

▼ Actual planner / checker application bodies

Mode and dispatch identities come from host captures.
Headers and OAuth are separate transport metadata and are omitted.

► Constructor specimens (not wire evidence)

Disclosed public input

Employee intent and capabilities
Admitted public advisory
Proposed approved method

**The inspected bodies exclude
private records, rule bodies
and the computed brief.**

Task/capability and transport metadata remain disclosed. The local host and employee are trusted.

An internal save must match the actual brief

Observed permitted action

1 exact internal record confirmed independently

Employee approves the current brief.
An independent reader checks its content
and artifact / action identities.

Stale save: no added effect
Manual external export: refused

The screenshot displays the 'OPERATOR CONTROLS' interface. At the top, it states 'The accepted policy, in your hands' with a 'Reload accepted state' button. Below this, a message indicates 'Accepted policy v16 · Feed v2 loaded.' The main configuration area includes several dropdown menus and input fields: 'Profile' (Standard), 'Strictness (reserved metadata)' (Standard), 'AI confidence threshold' (0,81), 'Privacy handling' (Block), 'Actor model' (gemini-3.5-flash), 'Checker model' (gemini-3.5-flash-lite), 'Shared call limit' (512), and 'Shared admission credits' (134217728). A row of checkboxes follows, with 'AI semantic inspection', 'Allow synthetic provider traffic', and 'Allow internal draft save' checked. Under 'Allowed models', 'Gemini 3.5 Flash' and 'Gemini 3.5 Flash-Lite' are also checked. At the bottom, there is an 'Activate policy' button and a status indicator 'Accepted policy v16 · Feed v2'. Two expandable sections are visible at the very bottom: 'Non-executable signature feed' and 'All accepted policy bounds'.

**Policy can block new dispatch.
Hostile advisory quarantined as a whole.
Actor, checker and tools share one
budget.**

Save evidence is retained and separately dated. A GET
screenshot makes no new save.

Evidence you can inspect; limits you should know

Retained actual evidence

Hosted AI returned the admitted methods
Local rebind changed the selected suppliers
Internal effects matched independent records
Audit, captures and measured spans
inspectable

339/339 offline checks in supplied evidence
Unknown dispatched work stays charged.

Four automated walkthroughs; no human rehearsal
Backup: seven paced historical UI captures

Material limits

Synthetic data; trusted host and employee
Hosted-only AI; no demonstrated local LLM
Peripheral ERP / email integrations
mocked
Potential opportunity, not achieved savings
No universal security or confidentiality
proof

Historical injection on/off test:
no causal protection gain established.
Forecast overrun remains in notes and
evidence.

Choose suppliers.
Prepare a useful negotiation brief.

AI composes the approved method.
Company facts and rules determine the result.
